Hello Professor

Today in the class talked to you regarding my project topic. I am sending you my project topic along with the outline.

Project name: "Find my car"(Application for android phone)

Description:

Main purpose of this application is to help the user to locate his car's position where he had last parked it.

Working:

This application will be using GPS location services. Firstly, when you park your car and activate this application, the application will note down and save the geographical location. Now when you want to locate your car, you will open the application, at this movement the application will read your current geographical location using the GPS of the phone. Then by using the Google maps API the application will let you know the shortest route to your car.

Please let me know if you have any questions or concerns.

Waiting for your approval.

Thanks & Best Regards

Vipul Madaan
